The principals of King BulkMaster Conveying and Elevating.

- Also described as en masse conveying this relates to the unique method of conveying bulk materials **cleanly, gently and economically.**
- Material is introduced into a sealed conveyor casing, horizontally, on an incline or vertically or a combination of the three. Versatility is the unique ingredient.
- Material is introduced into the conveyor at any point in a uniform load.
- The skeletal flight configuration (refer flight attachment options p. 9-10) induces the material to flow in a solid, placid column.
- The John King BulkMaster is **not a scraper conveyor.** There is no dragging or scraping action. The material simply moves forward as a solid, uniform mass.

The benefits of the King BulkMaster handling system.

- Capital costs Equipment proves to be competitively priced as compared to other forms of handling systems allowing for quicker pay back periods.
- **Power Consumption** Significantly lower as compared to other forms of handling equipment for example the system can be as low as 1/10 of dense phase conveying.
- Low cost maintenance Heavy duty rigid conveyor sections in simple modules, high strength forged conveyor chain, choke detection, overload and under-speed switches and high performance wear rails combine to ensure easy maintenance at infrequent intervals.
- Labour Saving Manual to fully automatic control of individual or multiple machines systems provided by proven and user friendly control systems.
- Environmentally friendly Totally enclosed machines and transfer points with dust tight and weather proof construction.
- Health and Safety compliant Safety assured with all moving parts fully enclosed and inaccessible. Explosion vent panels ATEX approved (94/9/CE) as required.
- Versatility and adaptability Unique features of King BulkMaster equipment offers best versatility in considering plant layout and adaptability in handling virtually all varieties of dry bulk materials.
- Gentle handling Material moved en masse as a solid, uniform and placid column with the chain skeletal form ensures degradation of vulnerable products is virtually eliminated. Chain flight design allows the material column to change direction through bends without degradation.
- **Proven performance** Established in 1926 John King has unique experience in handling bulk materials in a multiplicity of Industrial applications Worldwide.

King BulkMaster Conveying.

King BulkMaster machines employ the principal of en masse conveying. The chain flight will induce movement to its own physical depth and as a result the whole mass of material will flow forward at the same speed in a solid, placid column 'en masse'. Material dragging, particle tumbling or rolling does not occur.

King BulkMaster machines are manufactured within a standard range from 200 mm wide to 1500 mm wide with capacities of up to 2000 tons per hour (grain). All requirements can be catered for.

- Multiple inlets and or outlets will provide proportional capacity intake and output.
- BulkMaster two way machines will allow for material transport in both directions.

Popular BulkMaster Conveyor arrangements.

Standard straight running conveyor. Tensioning at the drive end as illustated or option of conventional tail shaft tensioning.

Standard straight running conveyor with horizontal to inclined sections. Tensioning at the drive end or option of conventional tail shaft tensioning.

Two way conveyor with material delivery from a single hopper. Material conveyed on a closed top deck to enable delivery to the bottom strand in a controlled manner. Single outlet at drive end. Conventional tail shaft tensioning as illustrated or option of tensioning at drive end.

Standard straight running conveyor with delivery from multiple inlets directly to the bottom strand. Baffle plates allow for controlled feed. Single outlet at drive end. Tensioning at the drive end as illustrated or option of conventional tail shaft tensioning.

Horizontal conveyor with open bottom deck for material leveling. Tensioning at the drive end as illustrated or option of conventional tail shaft tensioning.

King BulkMaster Elevating.

BulkMaster elevators employ the principal of en masse. The chain flight in its skeletal form is of a design that when immersed in the material will induce the whole mass of material to flow forward at the same speed in a solid, placid column within the casing of the conveyor. Elevator design allows the material to be moved in the horizontal then vertically or inclined plane or a combination of the two in a swan neck configuration.

King BulkMaster Elevators are manufactured in a standard range of sizes from 200 mm wide upwards enabling every customer requirement to be met.

Popular BulkMaster Elevator arrangements.

King BulkMaster Conveyor and Elevator construction.

Drive arrangements.

Two principal options are available. Firstly an integrally mounted geared motor unit driving the sprocket shaft through a totally enclosed chain drive incorporating a King design shear pin overload device. Secondly on large drives we employ a motor coupled to a gear unit through a coupling and mounted on an independent base.

Drive station with chain tranmission

Direct drive through a coupling

Drive and Tension terminals.

Shafts from best quality materials mounted on self-aligning ball and roller bearings. Shaft sealing affected with special high integrity packers. Sprockets with hardened and replaceable flanges for easy replacement. Panels over head and tail shafts allows for easy and safe inspection.

Tension terminal with screw takeup

Tension terminal with spring loaded "live" tensioning

Conveyor and Elevator casing.

Conveyor and Elevator sections manufactured from hot rolled strip mill steel. Standard recommendation for forged chain wear rail is high manganese steel offering unique work hardening properties. Modern manufacturing techniques ensure a high degree of accuracy ensuring perfect alignment between mating faces, outlets and ports.

Special features – For handling hot, wet, abrasive and or corrosive product special considerations to materials can be applied for casing materials, liners and chain components.

Forged conveyor chain.

King manufacture an unrivalled range of high quality forged chains. The standard is for an alloy steel forging and pin case hardened for wear resistance. Specifications can be varied dependent on the operating environment.

Flights are robotically welded in one of three manufacturing facilities in the UK, Poland and the USA. The integrity of the welding is fundamental to best performance.

The configuration will vary dependent on the style of machine.

Flight attachment options

T Type Attachments for Horizontal and Slightly Inclined Conveying

U Type Attachments for Horizontal and Inclined Conveying (with or without blanking plate)

C Type Attachments for Horizontal, Inclined and Vertical Conveying (with or without blanking plate)

OO Type Attachments for Horizontal and Inclined Conveying (with or without blanking plate)

CO Type Attachments for Horizontal and Inclined Conveying (with or without blanking plate)

Double Series Flight Options I Format

Typical dimensions and capacities.

Machine selection is based on long experience of the nature of the material to be conveyed which influences casing size, chain configuration and speed. Simple machines handling free flowing product will accept a higher speed and resultant throughput as compared to similar capacity machines with bends handling sticky and or abrasive products.

For guidance purposes only the tables provide outline machine dimensions ad typical maximum duties for two products Grain and Coal with differing handling characteristics.
